Voting Procedures

[Proposals](#)[Voting types](#)

What is a voting type?

Voting type defines how users can cast their votes and how the final result is calculated. Do not mistake it with the voting strategy though – a voting strategy is used to calculate the individual voting power of a user while the voting type calculates the outcome of the proposal.

Voting type is defined in the space settings or at the level of an individual proposal (unless it has been already defined in the space settings) and can allow the users to:

- Choose only one option – Single choice voting
- Spread their votes over multiple options – Weighted voting
- Approve a certain number of options – Approval voting
- Spread their votes over multiple options using the quadratic voting formula – Quadratic voting
- Rank the different choices in their order of preference – Ranked choice voting (Instant Runoff Voting)
- Abstain from voting while still participating in quorum – Basic voting

Let's have a look at each voting type in the next section.

Voting types

Single choice voting

Each user can select only one option. The results will reflect these votes as percentages of the total voting power of all voting participants cast on the specific choice.

Ideal for choosing one option from many. Pros: Most simple and common voting type which is easy to set up and use. Cons: Voters can pick only one option.
